

FOR IMMEDIATE RELEASE

November 8, 2005

RigMaster announces today that it is safe to use biodiesel to fuel the RigMaster® Power APU equipped with the Perkins 2 cylinder engine.

However recommendations come with a caution to use no more than a 5% blend (B5) of biodiesel in the diesel fuel used to power the unit and that the fuel must comply with ASTM standards. Biodiesel mixtures above 5% could result in filter blockage.

This recommendation is in line with the ATA's recent announcements on the usage of biodiesel.

"Because our unit runs off the same fuel tank as the truck this is important information for drivers who want to use biodiesel to fuel their vehicle." remarks RigMaster Power's General Sales Manager, Gary Lisson.

Biodiesel is a clean-burning alternative diesel fuel, made from soybeans, agricultural oils and fats or recycled restaurant grease. The EPA officially classifies biodiesel as a fuel additive that can be blended with petroleum diesel to be used in diesel engines with little or no modification. EPA studies have shown that it burns cleaner and increases the lubricosity of regular diesel which is an important factor for the new ultra-low sulphur diesel being introduced in 2006. The state of Minnesota has already mandated that all diesel sold in their state must contain 2% biodiesel.

"Our corporate goal and the basic principle of our product is to reduce fuel consumption and lower emissions for the transportation industry and studies seem to show that biodiesel can help to lower emissions even further," Lisson explains the companies position, "However we do not specifically endorse or discourage the use of biodiesel in our product; we simply want to pass along to our customers useful information about biodiesel that has been provided to us by the Perkins Engine Corporation."

The RigMaster® Power APU is a fully independent systems that provides heat, A/C, battery charging and hotel load power for the driver and burns 80% less fuel than an idling truck.
