

FOR IMMEDIATE RELEASE

January 5, 2007

RigMaster Power Corp. announces an array of new features and product enhancements on its 2007 model APU.

The most significant enhancements for 2007 are centered on the new Microprocessor controller which features a large LCD display, once-touch stop/start and climate control and single-tier access to all the menu features.

The new controller also offers the user the option to display information in either standard or metric, improved engine monitoring; including a low coolant sensor and adjustable voltage battery monitoring. Another addition to the design features is an in-cab 20 AMP GFI breaker easily accessible to the driver in the case of an overloaded fuse.

In addition, the RigMaster APU's popular AutoStart feature will become standard on all 2007 models. AutoStart feature includes timed and climate control automatic start mode as well as a low battery start up to ensure cold weather starts.

RigMaster is also pleased to announce a 1000 hour oil change interval for all 2007 model units. The extended oil change interval also applies to some of the later model 2006 RMP-14-6 units equipped with the larger 3 quart oil pan and all units powered by the Caterpillar C0.5 engine.

RigMaster Power Corp. manufactures and distributes the RigMaster Power APU in North America through a network of over 180 independent sales and service locations. For more information, log on to www.rigmasterpower.com.
